

Let us consider some facts: Worldwide, 50,000 neuron scientists are researching the brain. Every year 100,000 scientific papers are published about this miraculous organ

Is it possible that the human brain about which tens of thousands highly educated people have written hundreds of thousands of scientific papers has come about by chance, by random mutation?

No, it is absolutely impossible that coincidences could bring about such a wonderful organ which even thousands of scientist who have studied it over a life-time have not come to fully understand

In Lausanne, Switzerland, a worldwide unique project to create a virtual brain is being developed with a special super computer having been built for this purpose. But in order to achieve their goal the scientists would need a computer that is 20,000 times more effective than that state of the art super computer

If people succeeded to build a super computer which is capable of doing the same work as the 100 billion neurons of our brain with each neuron capable of sending hundreds of electrical signals per second, the electricity to run it would cost billions of Euro, while our brain does the job using less than 60 Watt

In other words, a computer would need dozens of Giga watts in order to do what our brain is capable of doing with just 60 Watt. This means that our brain is billions of times more effective than what scientists can come up with so far in the area of state of the art computer development. And this wondrous organ grows in just 9 months within the mother's womb. Such is the indescribable miracle of our brain!

To claim that this inconceivably specialized and finely tuned organ, where each neuron is uniquely shaped and connected with others neurons through one trillion synapses, about the same number as the leaves of the whole rain forest of the Amazonas, came about by chance is of course nonsense. Shouldn't all people be mature enough to face this fact?

To doubt that the human body was created by God Almighty, or whatever name we may use to refer to the Ultimate Reality, is indeed completely irrational and still there are people who think so superficially as to deny the existence of a wonderful Creator of our incredible cosmos

The brain is only one part of the miracle of our body with many incredibly complex functions which are finely tuned, surpassing even what modern technology is capable of producing, e.g. no camera is so flexible as the human eye

Now, in this 21st century, it is impossible to reasonably deny the existence of a Designer of the universe as the amount of information supporting this reality far outweighs, in terms of both clarity and quantity, theories designed to imply the opposite. We do not lack for knowledge of God however; only ignorance of this knowledge is an issue

The core question is no longer *"Do I believe in God?"* but only, *"How do I deal with the fact that God exists?"* When we have come to the conclusion that God is real our question will be how we will live our lives from then on

For those who are still not certain that our brain was absolutely created by a perfect designer, I would like to add a few more facts about neurons and their functions. When we learn something new, changes take place in our synapses and the connection between the neurons are changed to a certain extent. What is happening in our brain is that neurons learn from one another and find ways how to best work together. During the process of learning, not only new connections are made between brain cells but also new protein molecules are created which communicate with each other

Our brain is capable of storing and remembering the content of some 20 million volumes of books, in terms of a computer hard-drive it has a capacity of 2,5 petabytes, that is two and a half million gigabytes. Such an enormous amount of information is stored in our brain not only in the form of knowledge but also impressions from all of our five senses. In reality we can retrieve only a small portion of that enormous amount, and be consciously aware of that content

In 2009 scientists succeeded for the first time to create an actual three dimensional image of the brain with the help of laser technology in the centre for brain research in Vienna, Austria. In this way it is

possible to see how the neurons communicate with each other in the process of continuously comparing new knowledge with what is already known by the brain, focusing therefore on the storage work of newly gained insights

One brain cell has to choose from the information stored in thousands of other neurons at exactly the right moment in order to secure the proper functioning of the body where decisions have to be made even within a fraction of a second in critical situations

While in one moment a neuron makes a decision and it can be in the next moment in a position where a decision is made about it, causing it to function in a certain way in order to secure the purpose of the whole, our overall wellbeing and health as well as perfect functioning of all our organs and senses

Actually only 1 out of 10 decisions is made consciously. The 9 other decisions from among the thousands of moment by moment decisions which we make in the course of a day are happening based on our emotions. This fact confirms once again the centrality of our Heart and the importance of what kind of emotions we carry in us determine what is going on in our body

Even when we make conscious decisions our intuition plays a big part along with the experiences and insights we have gained in the past. With the help of magnetic resonance scanners (MRI) scientist could show that the brain had already made decisions before we had consciously decided on something. Up to 7 seconds before a person made a decision the scientists knew already which decision a person would make by watching the activity of the brain cells

The brain is the most complicated entity in the whole universe. One fifth of all the energy used by the body is burned in the brain where the electrical signals move with the enormous speed of 400 kilometres per hour from one neuron to the next whereby at each synapsis the message is received and passed on through certain chemical processes. All these electrical impulses combined are enough to make an electric bulb shine

Each neuron is connected with thousands of other brain cells in such complex connections that scientists are still incapable of understanding them completely. To make a comparison: Every single person of New York receives 10,000 cords and gives each end of a cord to one other person. Then multiply this situation 1000 times and you have a picture of the complicated connections existing in our brain. The total length of all nerve strings in our brain is nearly 6 million km, about 150 times the circumference of the earth

The number of elementary particles in the universe are 10 to the power of 80. The number of perception and meaning contents which one human brain can store is 10 to the power of 150, an unimaginably large number. I am sorry to say, but to claim that such a miraculous organ came about by chance is ridiculous. It is so perfectly constructed that even after decades of tens of thousands of neuron scientists researching it, there are still many questions that puzzle even the best specialists in brain research

Based on these facts we can confidently say that the existence of a designer of the universe is factually proven because such an incomprehensibly complex structure like the brain could have never ever come about by chance, random mutation or coincidence

In case someone would still not be certain about the existence of a Loving Creator you only need to have a closer look at all the other organs of the body in order to realize that it is definitely impossible for all the perfectly tuned functions to have come about simply by evolution. Alone the ability of the brain to decide each moment of our waking hours which information is important and which sensory impressions may be left without special attention, is a miraculous accomplishment of our brain which is only 2% of the weight of our body but it needs one fifth of all the oxygen the body uses because of its very specialized work

If somebody is still unsure concerning the wondrous qualities of our Creator one only has to consider other incredible facts about human beings, starting with our wonderful Heart that serves us each and every moment of our life, pumping about 2,000 gallons (nearly 8,000 litres) of blood each day. No manmade machine comes even near to being as effective as our self-regulating Heart which does not need any maintenance for about one hundred years of continuous incredible work. Every four months all our blood is completely exchanged

Our Lungs manage to breathe every day some 10,000 litre of air in and out of our body where millions of new cells are produced every second. 300 million cells are created every minute in order to substitute the cells that have been used up. Altogether our body consists of about 100 trillion cells whereby there are thousands of different kinds of cells active in our body which walks on average, twice the length of the world during a lifetime while breathing around 500 million times

If we take all these incredible abilities and functions to Heart we surely cannot help but marvel at the wondrous functions going on in our body. We are created as wonderful temples of Love in which the Designer of the universe dwells, a microcosm of the macrocosm, beautifully made in the image of our Heavenly Parent as His/Her son or daughter. This is our true dignity as a human being

There is no way anybody can reasonably deny the existence of a Creator of the universe who made a perfect plan or design for the miraculous worlds we find in both the microcosms as well as the macrocosm

How the situation in respect to God's creation developed may be compared to looking from a cliff down to the distant seashore where we see something shining in the sun. From a distance we may reasonably assume it is a wet stone with the surface reflecting the rays of the sun

When we come closer we find that it is not a stone but a mobile phone which was forgotten at the beach. To say that this telephone is a combination of elements which came together by chance is of course nonsense because we know that this is impossible

Similarly, the situation of man has been one of relative ignorance as we did not know too much about the incredibly complex structures and functions of the creation in the past, allowing for the possibility that e.g. life came about by evolution through random mutations

Meanwhile so many details have been revealed about the world we live in, that it is totally unreasonable to even consider that these immensely complicated and perfectly refined structures we find in this universe could have come about by coincidence

There is no logical or reasonable base whatsoever for claiming that there is no designer or creator of all the wonderful designs and beauty we find in nature. Still people doubt God's existence while pushing their reason aside and maybe coming up with some complicated intellectual theories where the actual problems on the level of their Hearts are hidden

It is important to realize that the problem of atheists is not an intellectual one, where they would need more proof of God's existence than what has already been given by people in the past and present. The real issue is an emotional problem of trying to ignore what is most obvious in order to avoid the responsibility which goes hand in hand with the acceptance of a Creator of the universe

The end of atheism has arrived because all people will come to know undeniably, that the cosmos was created by a Loving Designer and that we can connect directly in Heart with the Ultimate Origin of all existence
